3 POSITION INDEXING CYLINDER

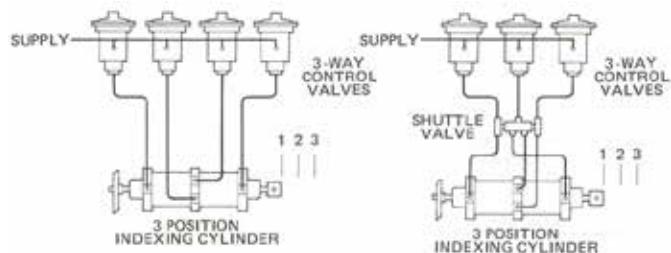

PRODUCT DESCRIPTION

DESCRIPTION The WM384 series indexing cylinder is a heavy duty pneumatic control device is frequently used in positioning applications. The unit consists of a pair of double-acting cylinders which share a common center barrier plate. In most applications, one piston rod is mounted in a fixed position while the other rod moves to a maximum of three positions. The WM384 cylinders are available with field-adjustable, factory preset, or fixed stroke configurations.

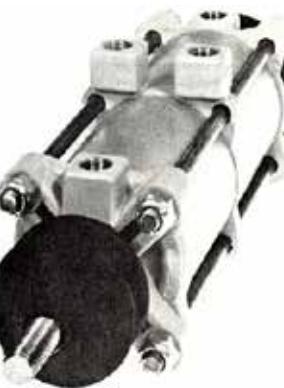

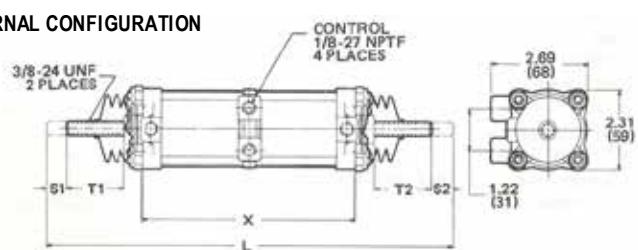

OPERATION The WM384 cylinder requires an air connection to each of its four ports. As illustrated below, the cylinder is normally controlled by four three-way valves or by three such valves with a dual shuttle valve. Pressure is simultaneously applied to two cylinder ports and exhausted from the other two ports. In response to the pressure signal, the pistons move to one of the stroke positions. The WM384 produces an actuating force equal to the effective surface area of the piston multiplied by the pressure applied to the piston.

APPLICATION The most common usage of the WM384 is in shifting systems of heavy duty automatic transmissions. The WM384 cylinders are also used for shifting auxiliary power take off units and operating clutch mechanisms on equipment such as drum winches. The WM384 cylinders may be purchased alone or in cylinder kits.

Service this unit with repair kit number R384-394. To replace the end cap assembly (Items 5,7 & 8), order part number 104190. To replace only the dust boots (Item 20), order part number 104039 for all models except the WM384J. For the WM384J, order part number 103867. To replace the cylinder, clevis, or clevis pin in a cylinder kit, order the appropriate unit as listed in the ordering information block. Other replaceable items are followed by part numbers. They cylinder shells, piston rods, and tie rods (Items 15-19) are replaceable although part numbers are not listed.

*Asterisk designates parts included in repair kit.

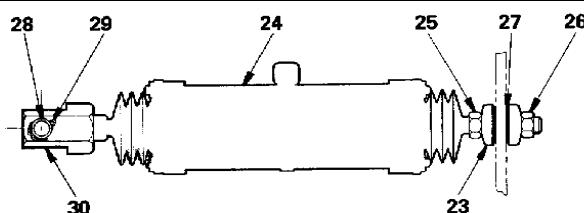

PORT SIZE.....1/8-27 NPTF
 MAXIMUM OPERATING PRESSURE.....150 PSI (1034, Kpa)
 OPERATING TEMPERATURE*.....-20°F to 200°F (-28.9°C to 93, °C)
 CYLINDER BORE.....2.00 in. (51 mm)
 CYLINDER STROKE.....Refer to Ordering Information Block
 EFFECTIVE PISTON AREA: Piston End.....3.03 sq. in (1955 mm²)
 Rod End.....3.14 sq. in. (2026 mm²)
 MOUNTING.....Mounting Provisions Included in Cylinder kits
 MOUNTING ATTITUDE.....Optional
 MATERIALS: Cylinder Shell.....Hard Anodized I.D. Aluminum
 Piston Rods.....Stainless Steel
 Pistons.....Fabric-Reinforced Phenolic
 Clevises:Steel
 O-Ring & U-Cup.....Buna N
 NET WEIGHT.....3 lb.-3 lb. 10 oz. (1.4-1.6 kg)

*For continuous operation beyond this range, contact factory.

4 POSITION INDEXING CYLINDER WM394

PRODUCT DESCRIPTION

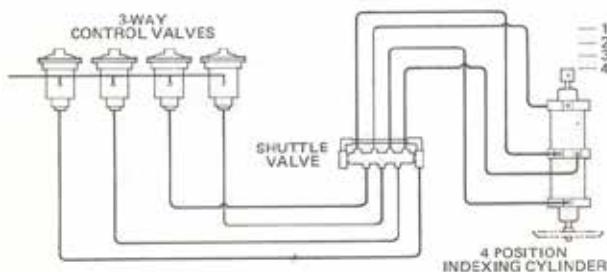

DESCRIPTION The WM394 heavy duty indexing cylinder serves as a pneumatic control device in positioning applications. Each unit is composed of two shorter double-acting cylinders that share a common center casting. The WM394 cylinders are available with field-adjustable, factory-preset or fixed stroke configurations. One piston rod is usually mounted in a fixed position while the other rod strokes to a maximum of four positions. If the stroke at one end is equal to twice that of the other end, the four stroke positions will be evenly spaced.

OPERATION As illustrated in the installation schematic below, a multiple shuttle valve and four three-way valves are normally used to pressurize the WM394 cylinder.

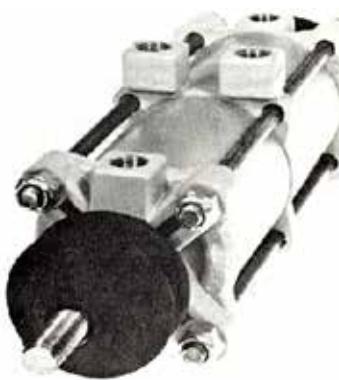

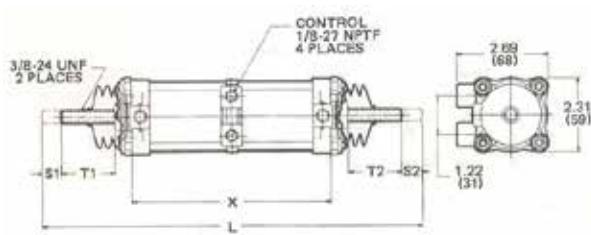

Pressure must be applied to one side of each piston to change the cylinder's stroke position. When two cylinder ports are pressurized, pressure is simultaneously exhausted from the two other ports, and the piston rods move to a new stroke position. The WM394 cylinder produces an actuating force that is equal to the piston's effective surface area multiplied by the pressure applied to the piston surface.

APPLICATION The WM394 cylinder is commonly used in shifting systems of heavy duty automatic transmissions. These cylinders are also used to shift auxiliary power takeoff units. Some WM394 models are available with mounting hardware in cylinder kits.

WM445, WM466, WM487

Brake Systems, Inc. Shift Control Devices include an operator control valve as shown above which routes air pressure to the appropriate actuator (cylinder or diaphragm type). One of the main uses of the product is for remote shifting of automatic transmissions (2-B-04) such as Allison, Clark, Twin Disc, etc. As this device is basically a sequence programming selector, it has many other uses such as single stick control of:

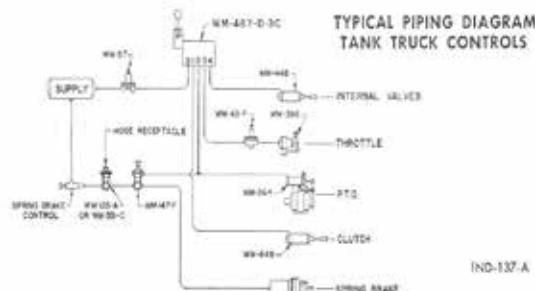

1. Cement Mixer.
 2. PTO clutch control for winch.
 3. Tank truck pumper.
 4. General industrial.

All valves are custom assemblies of similar parts while the difference in part numbers define such items as:

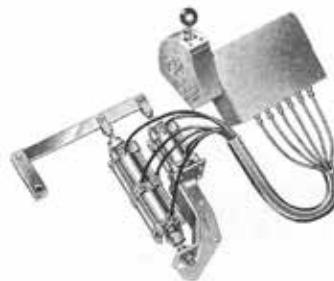

1. Number of valve units:
 - WM487 Series—4 valves
 - WM445 Series—6 valve
 - WM466 Series—8 valves
 2. Left hand or right hand assembly.
 3. Valve timing.
 4. Handle type.
 5. Shift gate pattern.
 6. Number of handle positions.

Heavy duty design includes these features:

1. Lightweight housings of cast aluminum.
 2. Shift gate labyrinth of long wearing malleable iron.
 3. Stainless steel cam shaft.
 4. Die cast cams.
 5. Low effort spool type valves.
 6. Air flow approximate 15 CFM (1/8" NPT ports).
 7. Rubber dust boot over each operating stem.
 8. Repair may be effected without complete disassembly by removal of outlet fitting from bottom of each individual valve as necessary.

WM448 SERIES HEAVY DUTY 2" CYLINDER

PRODUCT DESCRIPTION

DESCRIPTION The WM448 single acting cylinder is a spring-retumed pneumatic control device engineered for heavy duty vehicular or industrial service. Each WM448 model strokes to a fixed position (the stroke length options are listed in the ordering information block). On the stationary end of the cylinder, one of the following three end caps is used: (1) a die cast end cap with locknuts, rubber washers and a 3/8 -24 mounting stud; a cast iron end cap that features an integral trunnion and bushings for a 5/16 inch pin. On all cylinder models, the piston rod is threaded for installing a clevis or a rod end. A clevis and additional mounting provisions are included on cylinder kit configurations.

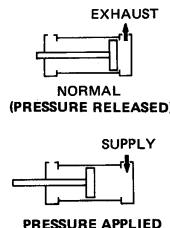

OPERATION The WM448 series cylinder requires only one air connection. A three-way control valve is normally used to deliver pressure to the cylinder's control port. When this port is pressurized, the piston strokes to its full stroke position. Because the cylinder is spring-loaded, the piston returns to its normal position when pressure is released. **IMPORTANT:** The return spring is designed to provide only the force required to retract the piston. If the actuated device requires any return force, an external spring should be added to the WM448 or double-acting cylinder should be used.

APPLICATION The WM448 series cylinders should be used only in applications where work is performed as the piston is extended. Typical applications include holding, clamping or positioning operations. In such applications, the cylinder repositions itself after each actuation.

WM449 SERIES HEAVY DUTY 2" CYLINDER

PRODUCT DESCRIPTION

DESCRIPTION Designed for industrial or vehicular applications, the WM449 is a heavy duty double acting cylinder. This two-position cylinder is available with various fixed stroke configurations. The stationary end of each cylinder model is equipped with one of the following three end caps: (1) a die cast end cap with locknuts, rubber washers, and a 3/8-24 UNF mounting stud; (2) a cast iron end cap that features an integral trunnion for a 1/2 inch pin; or (3) a die cast end cap that has an integral trunnion and bushings for a 5/16 inch pin. On all WM449 series cylinders, the piston rod is threaded for mounting a clevis or a rod end.

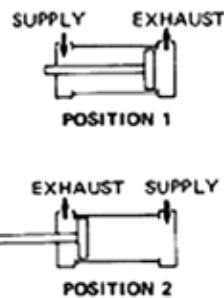

OPERATION The WM449 cylinder has two cylinder ports which require air connections. The ports receive pressure from either a pair of cam-actuated three-way valves (as shown in the installation schematic) or a four-way directional control valve. When one cylinder port is pressurized, the piston rod strokes to its full stroke position and pressure is exhausted from the other cylinder port.

APPLICATION The WM449 double acting cylinder is engineered for applications where linear operating force is required in both stroke directions. (For applications where operating force is required in only one direction, the WM448 series cylinders may be substituted.) The WM449 cylinders are frequently used a pneumatic control devices for power take-off units, transmission shift systems, or latching/unlatching functions. These cylinders are NOT designed for modulating or "feathering" applications.

WM447 SERIES HEAVY DUTY 2" CYLINDER

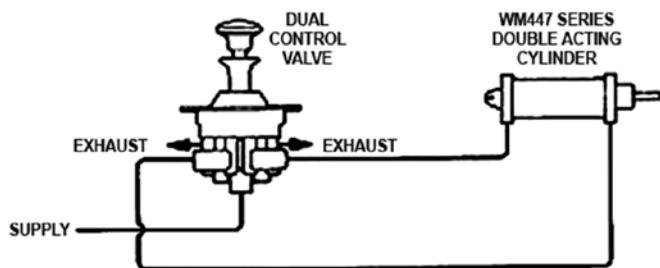

1/2" SS SHAFT, MODULAR IRON END CAP

PRODUCT DESCRIPTION

DESCRIPTION Designed for industrial or vehicular applications, the WM447 is a heavy duty double acting cylinder. This two-position cylinder is available with various fixed stroke configurations. The stationary end of each cylinder model is equipped with one of the following three end caps: (1) a die cast end cap with locknuts, rubber washers, and a UNF mounting stud; (2) a cast iron end cap that features an integral trunnion for a 1/2 inch pin; or (3) a die cast end cap that has an integral trunnion and bushings for a 5/16 inch pin. On all WM447 series cylinders, the piston rod is threaded 1/2-20 UNF for mounting a clevis or a rod end.

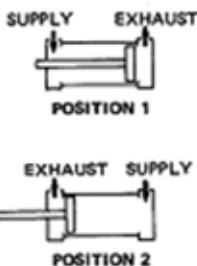

OPERATION The WM447 cylinder has two cylinder ports which require air connections. The ports receive pressure from either a pair of cam-actuated three-way valves (as shown in the installation schematic) or a four-way directional control valve. When one cylinder port is pressurized, the piston rod strokes to its full stroke position and pressure is exhausted from the other cylinder port.

APPLICATION The WM447 double acting cylinder is engineered for applications where linear operating force is required in both stroke directions. (For applications where operating force is required in only one direction, the WM446 series cylinders may be substituted.) The WM447 cylinders are frequently used pneumatic control devices for power take-off units, transmission shift systems, or latching/unlatching functions.

WM463 DOUBLE ACTING CYLINDER

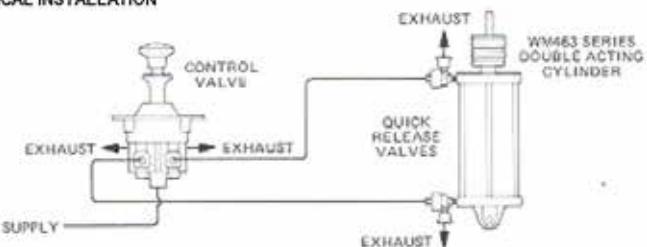

PRODUCT DESCRIPTION

DESCRIPTION The WM463 is a large double acting cylinder engineered for applications where linear operating force is required in both stroke directions. The stroke is fixed on each cylinder but the stroke length varies from model to model in the WM463 series (Refer to the ordering information block for available stroke length options.). All cylinder models have an integral trunnion for mounting and a threaded piston rod for a clevis. The longer the stroke models do not include dust boots.

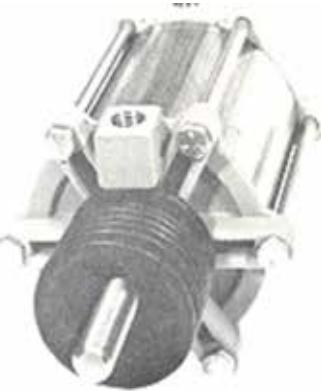

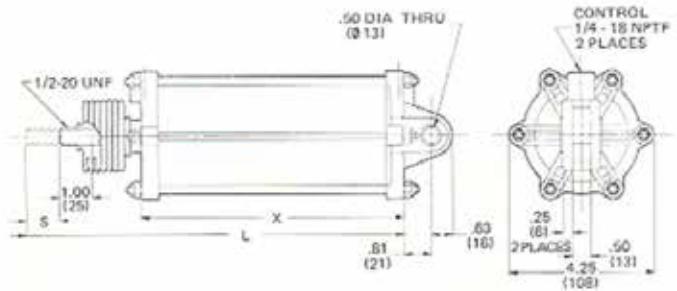

OPERATION Each WM463 cylinder has two ports which require air connections. To effect piston movement, pressure must be applied to one side of the piston. When one cylinder port is pressurized, pressure is exhausted from the other port and the piston strokes by a fixed amount.

APPLICATION The WM463 cylinder is commonly used to control mechanical devices on heavy duty industrial equipment. Since the WM463 cylinder produces more force than a 2.00 inch (51 mm) diameter cylinder, the WM463 is also used for direct-acting linkage applications such as the operation of two-position valves on dump trucks or the control of sequencing functions. The cylinder is normally pressurized by a single four-way control valve. Quick release valves are often used between the control valve assembly and the cylinder to improve the cylinder's response to the control signal.

WM464 SINGLE ACTING CYLINDER (SPRING RETURN)

DESCRIPTION: The WM464 is a single acting version of the WM463. It is a large single acting (spring return) air cylinder, typically used in automotive/industrial applications. It is available in one, two, and three inch strokes with spring return. The WM463 can be used with an air return and an infinite stroke to duplicate the spring return feature of the WM464. All cylinder models feature a die cast trunion end cap, set up for a 1/2" pin mounting. The piston rod is of 1/2" material, threaded 1/2-20 UNF. Several clevises are available (see page 020299) and are heat treated for longevity and strength.

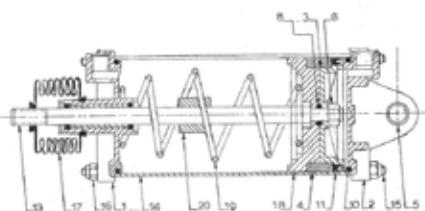

OPERATION: The WM464 cylinder has two ports (1/4-20 NPTF), one for air supply and one for breathing. A breather (WM111A), is available, or the WM124K remote breather kit.

APPLICATION: The WM464C approximates the physical size of the now obsolete Wagner A21301. 15 to 20PSI will cause the cylinder to full stroke, with additional air pressure required for work.

WM464 EXTERNAL CONFIGURATION

WM475 3-POSITION FEATHERING CYLINDER

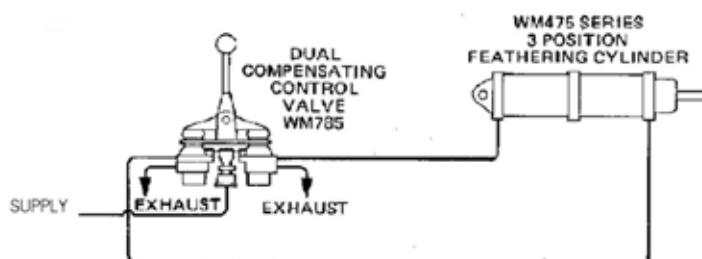

PRODUCT DESCRIPTION

DESCRIPTION The WM475 is a feathering cylinder used in systems that require infinite positioning in two directions from a given center position. The cylinder stroke in either the extension or retraction direction is limited to a fixed maximum. This stroke maximum varies according to the WM475 series model. Models also differ in the type of end cap used on the stationary end of the cylinder. The following end caps are available: (1) a die cast end cap with locknuts, washers, and a 3/8-24 UNF mounting stud; or (2) a cast iron end cap that incorporates a trunnion for a 1/2 inch pin. All WM475 models have a threaded piston rod for installing a clevis or a rod end.

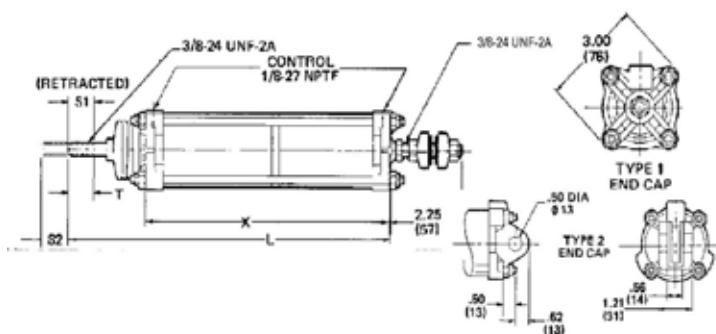

OPERATION To obtain variable positioning of the WM475, a compensating dual control valve is normally used to modulate pressure delivery to the ports. When pressure is applied to one cylinder port, it is simultaneously exhausted from the other. From the center position, the piston can be positioned at any point between the full extension and retraction positions, depending on which port is pressurized, and to what degree. When pressure is released from both ports, a spring centers the piston in the normal position.

APPLICATION WM475 cylinders are frequently used in air over hydraulic systems. Some common applications are remote control of hydraulic spool valves, hydrostatic transmission control (See WM796 catalog page.), and boom positioning in crane-hoist applications.

WM495 3-POSITION FEATHERING CYLINDER

PRODUCT DESCRIPTION

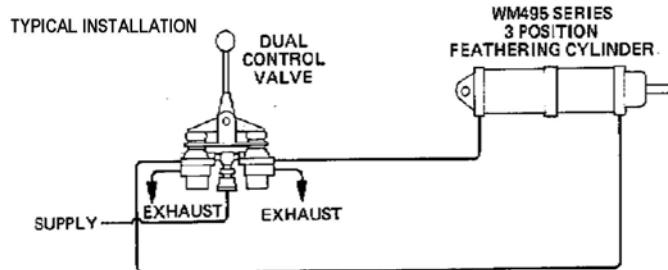

DESCRIPTION Designed for heavy force applications, the WM495B is a double acting feathering cylinder that has a 3.25 in. (83mm) bore. From the normal center position, the cylinder piston can stroke to any point between the maximum extension and retraction positions. The cylinder varies its stroke position according to the regulated pressure signal that it receives. To anchor the stationary end of the WM495B, the customer must supply a 1/2 inch pin for the built-in trunnion and bushings. The customer may also install a clevis or a rod end on the threaded end of the piston rod.

OPERATION To achieve infinite positioning of the cylinder, a compensating dual control valve is used to regulate pressure to the two cylinder ports. When pressure is applied to one port, it is simultaneously exhausted from the other. From the center position, the cylinder can stroke to any point between the full extension and retraction positions. The desired stroke is obtained by controlling the pressure signal to each port. When pressure is released from both ports, the cylinder is spring-returned to the center position.

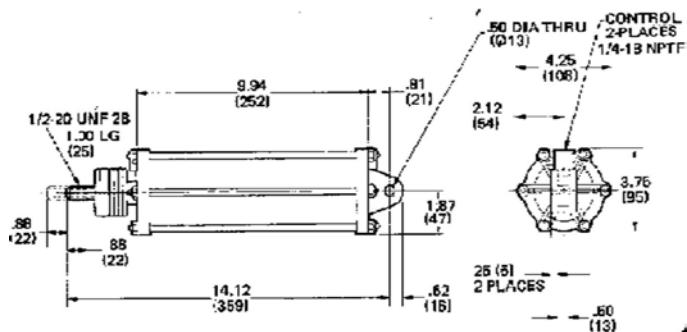

APPLICATION In air-over-hydraulic systems, the WM495B is often used for remote control operation of hydraulic spool valves. This cylinder is engineered specifically for heavy force systems such as large diameter hydraulic spool valves. A high-flow compensating dual control valve is normally used to modulate pressure to the cylinder. In some applications, two cylinders may be used in conjunction with a high-flow, compensating quad valve.

Brake Systems, Inc.

WM612 SERIES

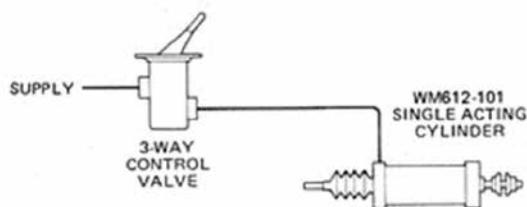

PRODUCT DESCRIPTION

DESCRIPTION The WM612-101 is a single acting, spring return pneumatic cylinder which is engineered for applications which require work to be performed by piston retraction. The WM 612-101's piston rod is threaded to accommodate a clevis or rod end, and the end cap on its stationary end is fitted with a 3/8-24 UNF-2A mounting stud.

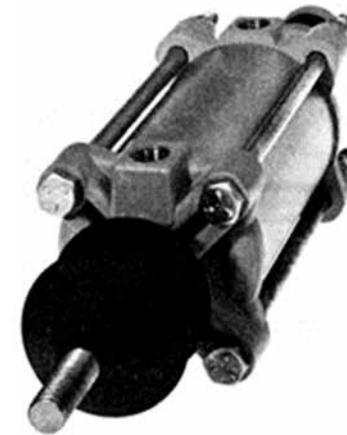

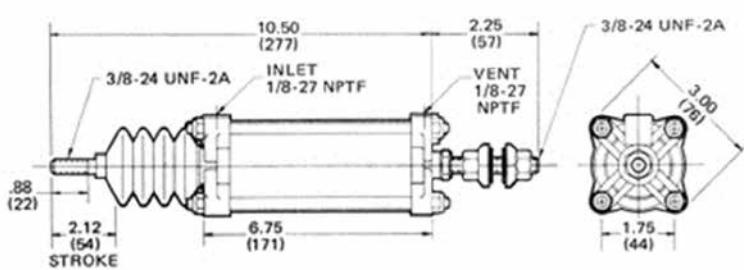

OPERATION The WM612-101 is usually used in conjunction with a three-way control valve. As the cylinder's supply port is pressurized, the piston retracts. When the pressure is released, the piston spring-returns to the extended position. **IMPORTANT:** The WM612-101's return spring is designed to provide only the force required to return the piston to the extended position. If any additional return force is required by the system; either ass an external spring to the WM612-101 or use a double acting cylinder.

APPLICATIONS The WM612-101 is used in industrial and vehicular applications which require a single-acting cylinder that applies operating force as its piston retracts. It is commonly used in clutch systems and positioning applications.

WM615-100

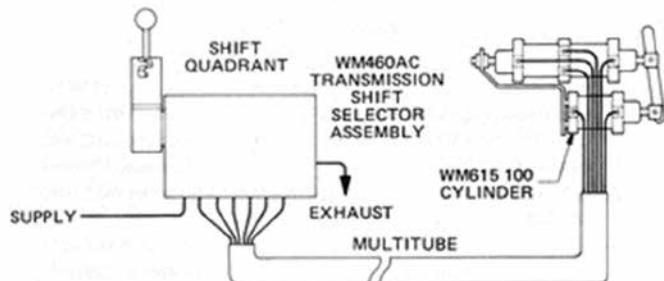

PRODUCT DESCRIPTION

DESCRIPTION The WM615-100 is a double acting pneumatic cylinder engineered for applications which require linear operating force in both stroke directions. It has a 2.00 inch (50.8 mm) diameter bore and a fixed stroke length of .1875 inch (4.76 mm). The WM615-100's piston rod is threaded to accommodate a clevis or rod end, and four bolts extend from its stationary end for mounting.

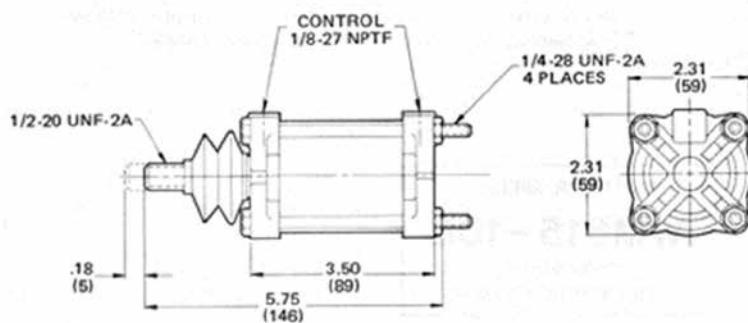

OPERATION The WM615-100 is usually used in conjunction with a four-way control valve which governs pressurization and release of the cylinder's two ports. As one port is pressurized, the piston strokes toward the other port, which exhausts through the control valve.

APPLICATION WM615-100 cylinders can be used in any application which requires a base mounted, double acting cylinder of their capacity and stroke length. They are commonly used in transmission shift cylinder assemblies and are sub-assembly components in WM460AC transmission shifters.

Brake Systems, Inc.

WM622 SERIES

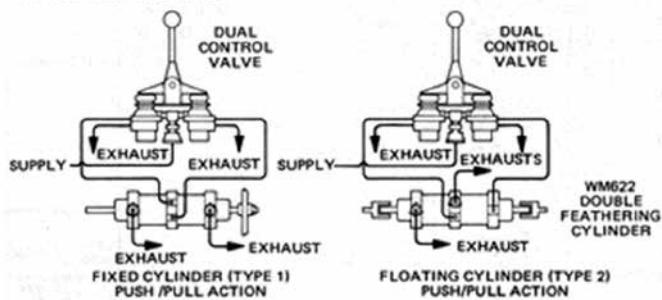

PRODUCT DESCRIPTION

DESCRIPTION The WM622 double modulating cylinder consists of two single acting cylinders that are mounted back-to-back on a common center casting. The cylinder modulates the position of each piston rod in response to pressure from a compensating dual control valves. The direction and length of both strokes vary according to the WM622 series model.

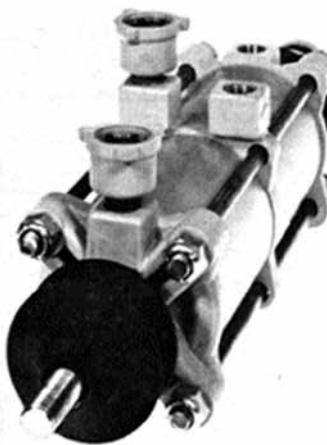

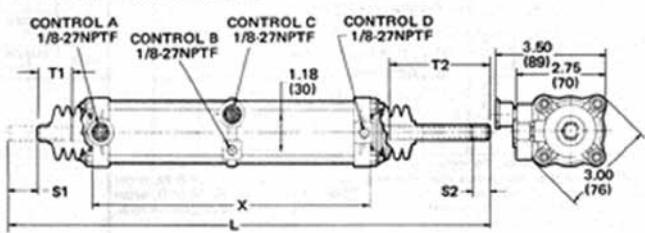

OPERATION Pressure lines are connected to two of the four WM622 cylinder ports. The remaining two ports are equipped with breathers which vent to the atmosphere and prevent dirt entry. All of the WM622 cylinders incorporate a spring which returns the piston to its normal position when pressure is released from the corresponding port. When pressure is applied to a port, the appropriate piston rod strokes in either the push or pull direction. The direction of stroke depends on the functional type of the cylinder, as shown in the functional diagram. Two functional types are available. Type 1 cylinders stroke in the push direction at both ends of the cylinder. On Type 2 models, one rod strokes in the push direction while the other rod has a pull-action stroke. On some models, the stroke length is adjustable and the customer must set the stroke to the desired length within the stroke range. Refer to the ordering information block for stroke length and direction specifications for each model.

APPLICATION The WM622 cylinder functions as a control device in many industrial and off-road vehicular applications. In air-over-hydraulic systems, these cylinders can be used to vary the positioning of hydraulic spool valves. In other applications, the cylinder is used for combination throttle controls which incorporate fast idle and multi-throttle functions. A compensating dual control valve or two single control valves are normally used to deliver pressure to the cylinder ports. WM622 series cylinders do not comply with FMVSS-124 regulations.

Brake Systems, Inc.

WM633B

PRODUCT DESCRIPTION

DESCRIPTION The WM633B is a spring-centered modulating cylinder with a 1.25 inch (32 mm) bore. The WM 633B is engineered for systems that require infinite positioning in either of two stroke directions for a fixed center position. The stationary end of the cylinder has an integral bushed trunnion for mounting with a customer-supplied 5/16 inch pin. The piston rod is threaded for installing a clevis or rod end.

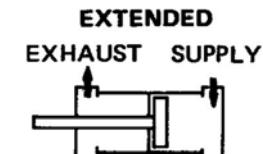

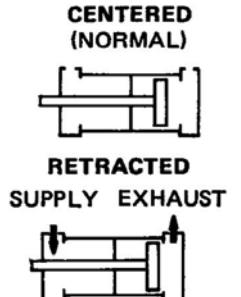

OPERATION The WM633 modulating cylinder requires an air connection for each of its two ports. Pressure is normally supplied by a compensating dual control valve that can apply a variable pressure to either end of the cylinder. When pressure is applied to one port, the other port is in the exhaust mode. By regulating pressure to one or the other port, the piston can be positioned at any point between the maximum extension and retraction positions. When both ports are vented to the atmosphere the spring returns the piston to the center position.

APPLICATION The WM633 is engineered primarily for the remote control operation of small hydraulic spool valves in air-over-hydraulic systems. Because of its compact size, this cylinder is ideal for applications where space is limited.

WM635 SERIES

DESCRIPTION The WM635 series single acting cylinder is a heavy duty, two-position pneumatic actuator device. Engineered for vehicular or industrial applications where space is limited, the WM635 is a 1.25 inch (32mm) diameter cylinder that is available with a variety of fixed stroke lengths. The stationary end of the cylinder incorporates a bushed trunnion for mounting, and the piston rod is threaded for installing a clevis or rod end.

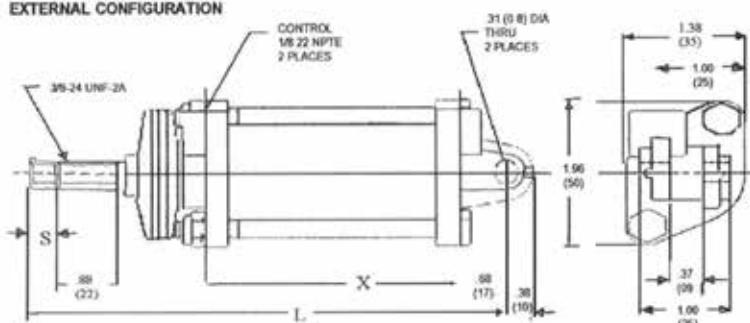

OPERATION The WM635 cylinder requires an air connection at one end. The cylinder port is normally pressurized by a three-way control valve or three-way valve and a three-way relay valve. Pressure must be applied to one side of the cylinder piston to effect piston movement. When pressure is applied to one port, the other port exhausts and the piston strokes a fixed amount. An internal spring returns the piston when application air is released.

APPLICATION The WM635 cylinder is engineered for applications where working force is required in one direction only. Typical applications include remote actuation of multiple spool hydraulic valves and latching/unlatching functions.

WM637 SERIES

DESCRIPTION The WM637 series double acting cylinder is a heavy duty, two-position pneumatic actuator device. Engineered for vehicular or industrial applications where space is limited, the WM637 is a 1.25 inch (32mm) diameter cylinder that is available with a variety of fixed stroke lengths. The stationary end of the cylinder incorporates a bushed trunnion for mounting, and the piston rod is threaded for installing a clevis or rod end.

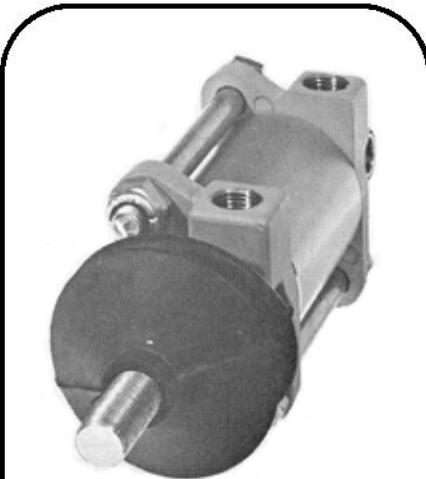

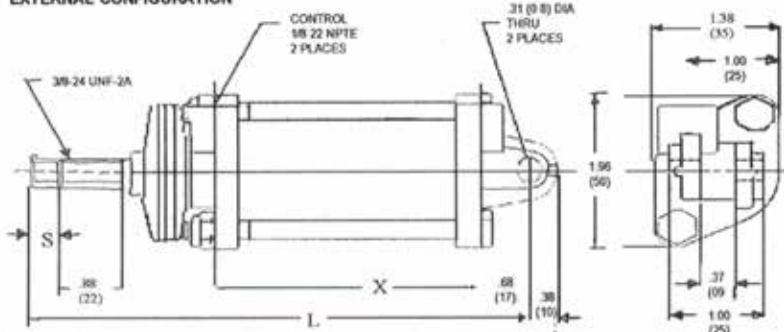

OPERATION The WM637 cylinder requires an air connection at each end. The cylinder ports are normally pressurized by a four-way control valve or three-way valve and a three-way relay valve. Pressure must be applied to one side of the cylinder piston to effect piston movement. When pressure is applied to one port, the other port exhausts and the piston strokes a fixed amount.

APPLICATION The WM637 cylinder is engineered for applications where working force is required in both directions of stroke. Typical applications include remote actuation of multiple spool hydraulic valves and latching/unlatching functions. The WM637 series cylinders are not designed for modulating or "feathering" applications.

WM637 SERIES

PRODUCT DESCRIPTION

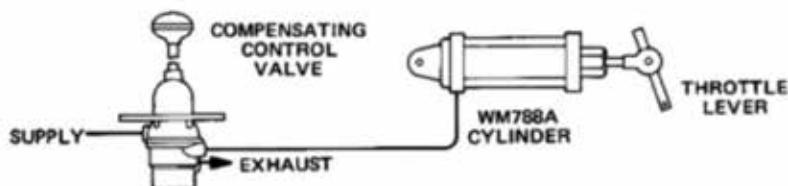

DESCRIPTION The WM788A is a single acting, spring-return cylinder engineered for industrial throttle control applications. It has a nominal stroke length of 1.5 inches (38.1 mm), and an adjustable preload regulated by a threaded stop nut. The WM788A's stationary end is equipped with a trunion for mounting and its piston rod end is attached to an engine's throttle lever with linkage supplied by the customer.

OPERATION The WM788A is used in conjunction with a compensating control valve to regulate the position of an engine's throttle lever. When the con-

WARRANTY POLICY TERMS AND CONDITIONS

For New Pneumatic Systems

Brake Systems, Inc. warrants that products furnished by it will be free from defects in materials and workmanship until the first of the following occurs:

One (1) year after delivery of the product to the ultimate user;

50,000 miles of operation on highway vehicles;

1000 hours of operation on other types of equipment.

This warranty does not extend to 1.) any losses due to misuse, accident, abuse, neglect, normal wear and tear, or improper installation, maintenance or application; 2.) products that have been repaired or altered outside of Brake Systems, Inc. factory unless authorized in writing by Brake Systems, Inc.; or 3.) any labor charges for removal and/or replacement of the noncon-forming or defective product or part thereof.

In the event that claims are made with regard to the defective product, the responsibility of Brake Systems, Inc. is limited to repairing or replacing any units which shall, within the provi-sions of the warranty specified above, be returned with transportation charges prepaid, and found to be defective. All warranty claims shall be presented within thirty (30) days after the defect is discovered. In no event shall Brake Systems, Inc. be liable for consequential damages related to misuse or misapplication of products.

The foregoing states Brake Systems Inc. sole responsibility for breach of this warranty. In no event shall Brake Systems be liable for consequential damages.

No other warranty, whether expressed or implied by operation of law or otherwise (including any warranty of merchantability, fitness or performance), shall exist in connection with the sale or use of any product sold by Brake Systems, Inc.
